

With **Finding Libraries**, you can reuse findings information and continuously build your organization's knowledge base. By linking libraries to specific field templates, you can now manage custom fields alongside standard finding data.

CREATING A FINDING LIBRARY

The first step is to create a Finding Library to house your templates.

1. Open **Settings** from the left-hand dashboard.
2. Navigate to **Finding Libraries**.
3. Click **+ Add Finding Library** (or edit an existing one).
4. Fill in the **Name**, **Description**, and **Status**.
5. Select the **Default Finding Template Status**.
6. **Select a Finding Fields Template:** Choose a template from the dropdown. This ensures that any finding added to this library retains its custom data.
7. Select **Managed by team**.

8. Click **Save**.

USE CASE:
INCLUDING

CUSTOM FIELDS

*If you are using custom finding fields, you **must** link your library to a specific **Finding Field Template** during the setup.*

Important: *If a library is not linked to a template, custom fields will be automatically stripped when findings are added to the library. To maintain data integrity, ensure your library configuration matches your project requirements.*

For more details on how to set up these fields, please refer to our [Finding Fields: Custom Finding Fields](#) article.

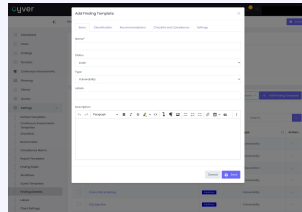

ADDING FINDING TEMPLATES

You can populate your library in two ways: manually creating a template or adding existing findings from a project.

CREATING A FINDING TEMPLATE MANUALLY

1. Click the **library name** to open it.
2. Click **+ Add Finding Template**.
3. Fill in the fields as you

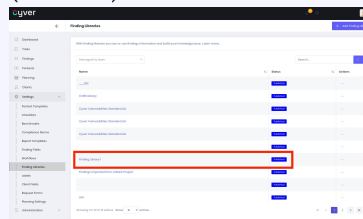

would when adding a standard finding in a project. Refer [to this article to auto-merge findings with Finding Templates](#)

4. Click **Save**.

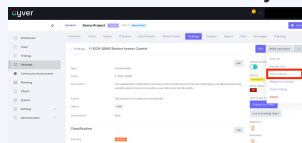

ADDING AN EXISTING FINDING TO THAT LIBRARY

Before adding findings, make sure the **library status** is **Published** (not Draft).

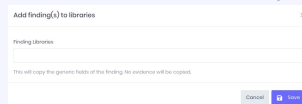

FROM FINDING DETAILS

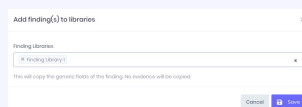

1. Open a finding in a project, click the **three dots** menu, and select **Add to Library**.

2. Choose the desired **library**.

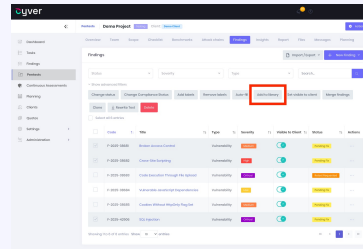

3. In this example, we are adding this finding to the library recently created and **Save**.

BULK ADD

In the project findings list, select multiple entries and use the **Add to Library** button at the top.

DATA CONSISTENCY:

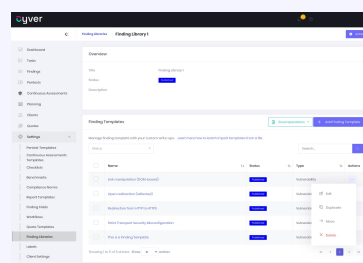

When adding findings to a library, only the custom fields that match the library's linked **Finding Fields Template** will be copied.

MANAGING TEMPLATES AND LIBRARIES

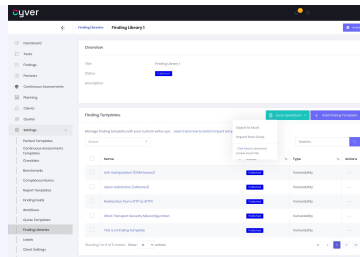

Once your templates are in the library, you have several management options:

TEMPLATE MANAGEMENT

- **Edit/Delete/Duplicate/Move:** Accessible via the **three dots** menu on the right side of each individual template entry. You can quickly clone a template or move it to a different library.

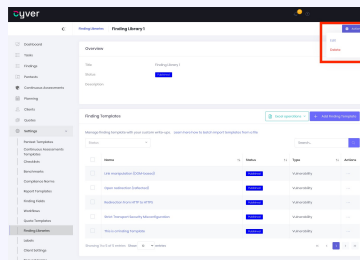

- **Excel Operations:** Use the **Excel operations** button to **Export to Excel** or **Import from Excel**. The import process considers the library's specific field settings.

LIBRARY ACTIONS

After clicking on a specific library, you can use the **Actions** menu in the top right corner to:

- **Edit:** Update the library title, description, or change the linked **Finding Fields** **Template**.
- **Delete:** Permanently remove the entire library and its templates.

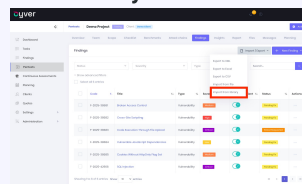

IMPORTING AND MERGING

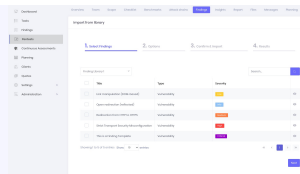

IMPORTING FROM A LIBRARY

You can pull full templates directly into your project:

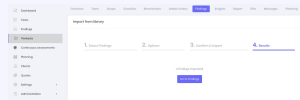

1. In your project's **Findings** tab, click the **Import/Export** button and choose **Import from Library**.

2. Filter by library and select the templates you need.

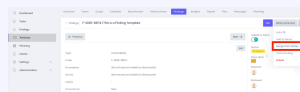

3. Follow the 4-step wizard to confirm. All imported findings will appear in **Draft** status and will not be visible to clients initially.

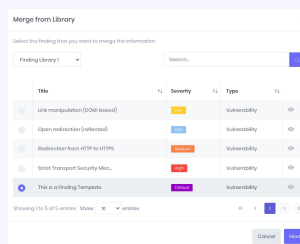

MERGING FROM A LIBRARY

The **Merge from Library** feature lets you update an existing finding with information from a gold-standard template:

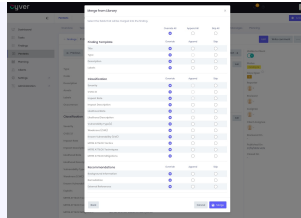

1. Open the **Finding Details** page and select **Merge from Library** from the **three dots** menu.

2. Choose the template you want to source information from.

3. Select the Finding Template whose information you want to merge. (In this example, we have pre-edited the template's description as **This is a Finding Template** so you can see it updated in the project finding.)
4. Click **Next**, then select the fields you want to merge.

After merging, the selected fields (e.g., **Description**) will be updated successfully.
