

There is a trick we always suggest to solve the "How to mass import findings to library?" question and here is how:

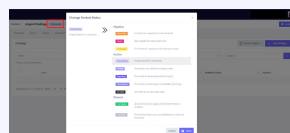

1. Create a Test/Blank Project

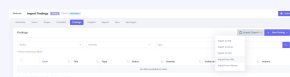

2. The status of a newly created project is Onboarding and while a project is on-boarding, it is not possible to add findings

3. Click on the status of the project to change it manually and move it to Testing for example

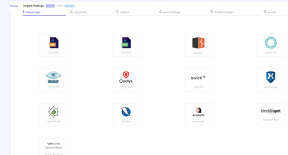

4. Click on Import/Export and choose Import from file

5. You can choose among the different options. Findings can be imported from a tool/scanner or you can create and upload a csv or an xml file

Important note: In case you can not find what you need, you can always request a new integration

for your field of work.

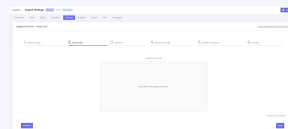

In order to make a successful import, the provided csv or xml file needs to follow a specific format and there are rules for the columns to be met on the provided files.

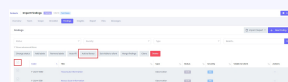

To import findings from a CSV File, check this article: [Import Findings from CSV File](#)

To import findings from a XML File, check this article: [Import Findings from XML File](#)

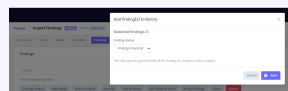

6. This is a six-steps process so once you choose type, you can see the progress in the bar

7. Once the import process is finished, select all the Findings you will now import to a Finding Library to reuse them

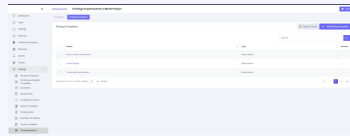

8. Click on Add to library and choose a library

After you save to confirm the action, if you go to check the

Finding Templates of the
Finding Library chosen above,
the selected findings have been
imported.

To re-use findings from
Findings Libraries on different
projects, check [this article](#).
