

You can use the Integrated Vulnerability Scanner to offer PTaaS, DAST, & attack surface management. The integrated vulnerability scanner is reNgin.

## ACTIVATION

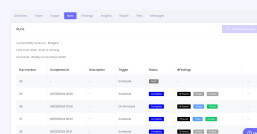

This is an Add-on, please contact us to activate.

Once activated, you can enable it in the continuous project.  
[read more about continuous projects.](#)

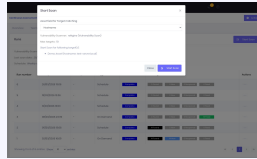

## STARTING A SCAN

To start a new scan, you press the "Start Scan" button in the Runs tab.

Select Asset fields for Target matching:

- Hostname
- IP

This will trigger the scanner to start a on-demand scan for the Assets in scope.

The scanner will target the **hostname** or **IP** fields of your assets.

The scanner is running from the following IP:  
**104.26.4.11**

You may need to allow this IP in the targets firewall for better results.

## SCHEDULE AND ON-DEMAND SCANS

You can activate the Schedule Scan for weekly automated scans:

## RENGINE SCANNER

reNginer has advanced reconnaissance

capabilities, harnessing a range of open-source tools to deliver a comprehensive web application reconnaissance experience. [More information.](#)

## CONFIGURATION

The following tools are included in the Standard reEngine configuration:

- Nuclei Scan
- Dalfox XSS Scan
- CRLFuzz
- Port scan

The following tools are not activated:

- OSINT
- Subdomain discovery

## SELF HOSTED RENGINE

If you have your own reEngine instance, you can select what scan engines and project is exposed to Cyver while configuring the integration.

To know what is the slug of your project, navigate to /projects and check the information on the table:

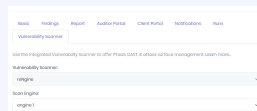

To know what is the Id of the Scan Engine, navigate to your reNgine portal and go to the Scan Engines list. Click on the arrow icon (edit) and you'll have the Id on the URL.

E.g.:

.../scanEngine/{project slug}/update/1

The scan engine can be selected on the Project Template or Project settings.

## LIMITATIONS

Currently, reNgine does not allow a **Target** to exist on more than 1 **Project**. You have to be sure that the target you are trying to scan, exists on the scope of your **Project** (identified by the project slug).

For example, if you have an existing *Target1* on *Project A*, and you try to run a

scan for that same  
target on *Project B*, it  
**will fail.**
