

This guide explains how to use the attack chain diagram token in reports using a query string-like syntax.

BASIC STRUCTURE

The token uses URL-style parameters separated by `&` characters. For example:

```
{AttackChain_Diagram?  
scenario=<scenario>}
```

In the case that a scenario name is not specified, an alternative parameter can be used to select which scenario to include when you have multiple scenarios available and don't specify a name (starting from 1). This adds a scenario according to its order in the Attack Chains tab in the pentest. If you use the name of the scenario, this will be ignored.

```
scenario_seq=1
```

EXAMPLES

```
{AttackChain_Diagram?  
scenario=<scenario>}
```

```
{AttackChain_Diagram?  
scenario_seq=1}
```
