

Cyver Core supports 2-factor authentication for every type of account. Administrators can choose to require 2-factor authentication during account setup.

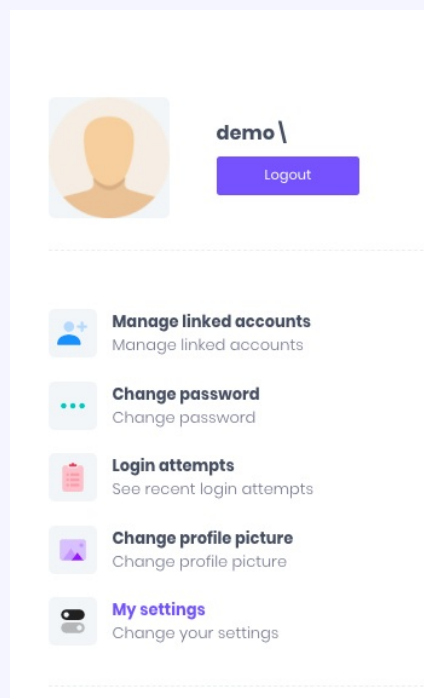

Any user can also choose to turn on 2-factor authentication, using either email authentication or Google Authenticator:

From your Cyver Core Account:

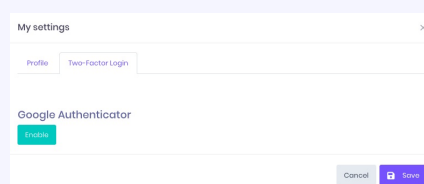

- Click your user email at the top right-hand corner of the interface

- Click "My Settings"

- Click "2-Factor Authentication"
- Click "Enable"

If you'd like to use Google

Authenticator:

- Click “Enable” under “Google Authenticator”
- Scan the QR code with your app
- Finish setup in the app

Google Authenticator is more secure than email. Therefore, if you’re accessing very sensitive information, are using Cyver Core through unsecured or public WIFI, or work in a high-security industry, we recommend using Google Authenticator.
