

To be able to access the Cyver Core API on your portal, you first need to check if you have the Professional or Enterprise [plan](#). Then you need to go to the side menu **Administration -> Portal**, select the tab **API**, tick the checkbox "**Enable Cyver Core API feature**" and press save. After that the API is enabled and all your team have permission to use it.

CLIENT API ACTIVATION

We also offer controlled API access to your clients if you wish so. To enable it on a specific client, you need to navigate to **Clients** on the side menu, select the client you want to give permissions to use it and select the **Integrations** tab. Click on the switch and the API will be enable for them.

If all is setup correctly, your client will see this on their **Settings -> Integrations** portal.
