	Team of the user who created

{TeamName}	the finding (either the Portal Name or Client Name)
{Project_CustomField?Field=FieldName}	Pulls the value of a specific custom project field

HOW TO USE CUSTOM PROJECT FIELDS AS EMAIL TEMPLATE TOKENS

You can pull data from any [Custom Project Field](#) directly into your emails.

To do this, insert the {Project_CustomField?Field=FieldName} token from the dropdown, and replace **FieldName** with the exact internal name of your custom field.

Example: If you have a custom field named `priority`, you would format the token in your email editor like this: {Project_CustomField?Field=priority}

When the email is triggered, the system will automatically replace this token with the actual data entered into that custom field for that specific project.
